

OSCILLATORY MOTION AND WAVES

NJ-OER TOPIC-16

- Relate period, frequency and angular frequency for an oscillatory motion
- Distinguish between the motion parameters $A, f, T, w$ and the dynamic properties such as mass, moment of inertia, spring coefficient, gravity etc.
- Calculate motion parameters from the dynamic properties
Learning Outcomes
- Describe a simple harmonic oscillator equation
- Write the equation of motion using the motion parameters
- From a given equation of motion, estimate motion parameters and dynamic variables
- Explain the link between simple harmonic motion and waves.
- State characteristics of waves and standing waves
- Understand the role of wavelength in destructive and constructive interferences

F= force
$\mathrm{k}=$ spring constant
x= displacement from equilibrium
position
$\mathrm{f}=$ frequency
T= period
$\omega=$ angular frequency
Concepts
A = Amplitude of displacement
$\theta=$ angular displacement
Өmax=Amplitude of a pendulum
$\phi=$ phase constant
$\mathrm{m}=\mathrm{mass}$
Vmax= maximum velocity
amax= maximum acceleration
$\lambda=$ wavelength

## SI UNITS

Force is in Newtons
Frequency is in Hz
angular frequency is in rad/sec
Period is in seconds (s)
Units angular displacement is in radians
phase constant is in radians
Mass is in Kg
wavelength is in meters ( m )
Amplitude is in meters ( m )
Velocity is in $\mathrm{m} / \mathrm{s}$
Acceleration is in $\mathrm{m} / \mathrm{s}^{2}$
$f=1 / T$
$f=1 / T$
$\omega=2 \pi f 2 \pi f$
Springs
$\mathrm{F}=-\mathrm{k}\left(\mathrm{x}-\mathrm{xo}_{\mathrm{o}}\right)$
$\mathrm{E}=1 / 2 \mathrm{k} \mathrm{A}^{2}$
$E=1 / 2 m$ vmax ${ }^{2}$
$x=A \cos (\omega t) x$-oscillation starting at $A$
$x=A \cos (\omega t+\phi)$
$\omega^{2}=k / m$
Pendulum
$\theta=\theta \max \cos (\omega t+\phi)$
$\omega^{2}=g / L$ Simple Pendulum
$\omega^{2}=\mathrm{mgR} / \mathrm{I}$ Physical Pendulum
Waves
$v=\lambda f=\lambda / T$

## KEY STRATEGIES

$f, T$ and $\omega$ are related, knowing one means knowing all $f=1 / T \omega=2 \pi f$
Above equations applies to all Simple Harmonic Motion (SHM)
The equation that connects dynamic variables to kinematics are different for each system $\omega^{2}=\mathrm{k} / \mathrm{m}$ for spring $\omega^{2}=\mathrm{k} / \mathrm{m}^{2}=\mathrm{g} / \mathrm{L}$ for the simple pendulum

If the equation of motion is given, $A, \omega, \phi$ can be found by matching the variables. Other unknowns can be calculated

If $A, \omega, \phi$ are given or can be calculated, equation of motion can be found by substituting $\Phi=0$ If the motion starts from xmax=A

## CLASSWORK FOR SHM OF A SPRING

Mass " $m$ " is oscillating on a spring with spring coefficient " $k$ " along the $x$-axis with amplitude $A$. Complete the table below using the known values and equations

| A Amplitude meters | f Frequency Hz | T Period s | w Angular Frequency radHZ | k Spring Coefficient N/m | m Mass kg | Energy Joules | Equation A cos(wt) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2.4 | 5.0 |  |  | 200 |  |  |  |
|  |  |  |  |  | 4 |  | $5 \cos (7 \mathrm{t})$ |
|  |  | 5 |  | 20 |  | 40 J |  |
|  |  |  |  | 9 |  |  | $3 \cos (3.14 \mathrm{t})$ |

$$
x=A \cos (w t) f=1 / T \quad w=2 p i f \quad w=s q r t(k / m) \text { Energy }=1 / 2 k A^{\wedge} 2
$$

## GRAPHING SIMPLE HARMONIC MOTION

## Frequency

Simple Harmonic Motion

Amplitude

## CLASSWORK ON GRAPHS

Q1)Determine the amplitude and the period of the simple harmonic motion on the graph

Q2) Graph a simple harmonic motion graph with amplitude of 2.2 m and frequency of 0.2 HZ Q3) $y=4.2 \cos (\pi t+\pi / 4)$ is given. Graph the motion as $y$ vs $t$.

## ACTIVITY OSCILLATIONS

Determine the spring coefficient by measuring the period. Go to the link below.
https://phet.colorado.edu/sims/html/masses-and-springs/latest/masses-and-springs en.html
Reduce damping to zero from the toolbar at the right, click on period trace
Drag the timer from the bottom right. Attached the mass to the spring and pull it down.
Adjust your mass and spring constant using the slider tools at the top.
Start your timer. In order to increase accuracy, you must count ten oscillations and stop the timer. (App works better at slow motion.)
Divide the measured time to ten, this should give you your period "T".
Using the values for mass and period calculate the spring coefficient using the equation. $T^{2}$
$=4 \pi^{2} \mathrm{~m} / \mathrm{K}$ Change the spring coefficient and repeat the activity $\mathrm{k}=4 \pi^{2} \mathrm{~m} / \mathrm{T}^{2}$

| Mass (kg) | Spring Constant | Time for 10 Oscillation | Period T (s) | $\mathrm{k}(\mathrm{N} / \mathrm{m})$ |
| :--- | :--- | :--- | :--- | :--- |
| 0.100 | small |  |  |  |
| 0.200 | small |  |  |  |
| 0.050 | medium |  |  |  |
| 0.300 | large |  |  |  |

## ACTIVITY OSCILLATION $=$

Determine the spring coefficient by measuring the period for each of the case on the table using the PhET app https://phet.colorado.edu/sims/html/masses-and-springs/latest/masses-and-springs en.html

| Mass (kg) | Spring Constant | Time for 10 Oscillation | Period T (s) | $\mathrm{k}(\mathrm{N} / \mathrm{m})$ |
| :--- | :--- | :--- | :--- | :--- |
| 0.100 | small |  |  |  |
| 0.200 | small |  |  |  |
| 0.050 | medium |  |  |  |
| 0.300 | large |  |  |  |

## SIMPLE PENDULUM

It is not advisable to use w for the simple pendulum. Because w can be used for angular speed which is a variable and angular frequency which is a constant.

## CLASSWORK SIMPLE PENDULUM

Mass " $m$ " is attached to a string with length "L" and oscillating on a planet with gravitational constant $g$. Complete the table below using the known values and equations

| A Amplitude <br> radians | f Frequency <br> Hz | T Period <br> s | Length <br> meters | Gravity g <br> $\mathrm{m} / \mathrm{s}^{2}$ | Equation <br> $\mathrm{A} \cos (2 \pi \mathrm{ft})$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 0.4 | 5.0 |  |  | 9.8 |  |
|  |  |  | 1.0 |  | $5 \cos (7 \mathrm{t})$ |
| 0.2 | 5 |  | 20 |  |  |
|  |  |  |  | 9 | $3 \cos (3.14 \mathrm{t})$ |

$\theta=\theta \max \cos (2 \pi f t) f=1 / T \quad 2 \pi f=s q r t(g / L)$

## WAVES

PHYSIC • ••
The component of WAVE

VISIBLE SPECTRUM

$v=\lambda f=\lambda / T$
Intensity = Power/Area
Spherical Waves
I = P/(4 $\left.\pi r^{2}\right)$
Superposition and Interference of two sources
$A=A 1+A 2$ constructive
$A=|A 1-A 2|$ destructive

## CLASSWORK ON WAVES

Q1) What is the wavelength of an earthquake that shakes you with a frequency of 13.0 Hz and gets to another city 50.0 km away in 15.0 s ?

Q2) Using the graph, find the wavelength of the wave that has a velocity of $4.0 \mathrm{~m} / \mathrm{s}$.

Q3)Radio waves transmitted through space at the speed of light ( $3.010^{8} \mathrm{~m} / \mathrm{s}$ ) by the Voyager spacecraft have a wavelength of 0.120 m . What is their frequency?

Q4) Draw $y$ vs $x$ graph and $y$ vs $t$ graph of a wave with amplitude 2.0 m , period 2.5 seconds and speed $4.0 \mathrm{~m} / \mathrm{s}$ Q5) Two pulses with amplitude 0.2 m and 0.3 m interferes. Calculate the resultant amplitude if they are constructive or destructive

## STANDING WAVES

$$
f_{1}=\frac{V_{w}}{2 L} \quad \lambda_{1}=2 L
$$

$$
f_{2}=\frac{v_{w}}{L}=2 f_{1} \quad \lambda_{2}=L
$$

$$
f_{3}=\frac{3 V_{w}}{2 L}=3 f_{1} \quad \lambda_{3}=\frac{2}{3} L
$$

For a standing wave, nodes are the points that does not oscillate
Antinodes are the maximums of the oscillation
Number of antinodes of a graph gives " n "
$f=n V w /(2 L)$ where $V w$ is the wave velocity $f$ is the frequency and $L$ is the length
$\lambda=2 L / n$

## CLASSWORK STANDING WAVES

Q1) For a standing wave on a 2 meters long string, the second overtone is $f 3=1500 \mathrm{HZ}$. Find the third overtone $f 4$ and calculate its speed

Q2) Wave speed on a 0.25 m long string is $460 \mathrm{~m} / \mathrm{s}$. Calculate the first three possible frequencies on that string
Q3) Draw a standing wave with 4 nodes on a 1.5 meters long string.
Q4) Find the wavelength for the fundamental frequency if $f 5=2125 \mathrm{~Hz}$ and wave speed is $450 \mathrm{~m} / \mathrm{s}$.

## ADVANCED CLASSWORK FOR STANDING WAVES

A string instrument has length "L", mass " $m$ " and it is under a force of tension "Ft". String produces sound with frequency "fn" by forming standing waves with $n$ number of antinodes. Complete the table below using the known quantities and the formula.

| f Frequency <br> Hz | Wavelength <br> $(\mathrm{m})$ | n | Force of <br> Tension Ft | Length (m) | Mass (kg) | Mass Density <br> $\mathrm{m} / \mathrm{L}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathrm{f4}=$ ? |  | 4 |  | 0.50 | 0.004 | Velocity |
| $\mathrm{f5}=1000 \mathrm{~Hz}$ |  |  | 0.80 | 0.005 |  |  |
|  | 0.25 |  |  | 0.75 | 0.006 |  |
| $\mathrm{f6}=?$ |  | 6 | 0.60 | 0.003 |  |  |

$$
v=\lambda f=\lambda / T \quad v^{2}=F t /(m u) \quad m u=m / L \quad \lambda=2 L / n \quad f=n v / 2 L
$$
